

## Why a MANGER® Zerobox?

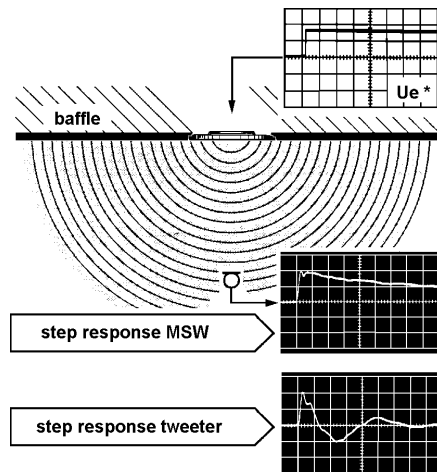

### An invisible **problem**:

Loudspeaker cabinets distort the pressure changes by their size and influences recognizably the sound, even with the Manger® sound transducer (MSW).

### An **ideal solution** are ...

...baffles – they don't set audible reproduction limits. The necessary prerequisite for this is the Manger® sound transducer...

...because conventional loudspeakers with mass-spring action set audible reproduction limits despite the ideal baffle.

### Our **solution** is...

the "Zerobox®"

Side-mounted Manger® sound transducers eliminate the audible pressure change occurred by the cabinet and realise an infinite baffle with a small cabinet.
